

Report of Installation on 11kW Escalator At Herold Center, Norderstedt Germany (> 14% Savings with Payback < 2.0 Years)

The Herold Center is one of the focal points of the shopping facilities within Norderstedt near Hamburg in Germany. Like the majority of such facilities it is open for long periods of time every day and has to run the services all of the time in order to ensure customer comfort. The escalators and moving walkways are an integral part of this site and all of them operate for in excess of fourteen hours a day, seven days a week.

**The Up Bound Walkway to which
EnviroStart was fitted is on the Right**

The trial installation described here was on the up-bound walkway shown in the photograph to the right. The up-bound was chosen because it was felt to be a higher load than the down walkway.

All escalator and walkway systems are very highly geared as they have to convert the four-pole 1500RPM motor speed into something more acceptable to personnel transit. This gearing means that most escalators have motors of 22kW or less irrespective of their size or angle of incline.

The installation at the Herold Center was established on default settings with the soft start time at 20s.

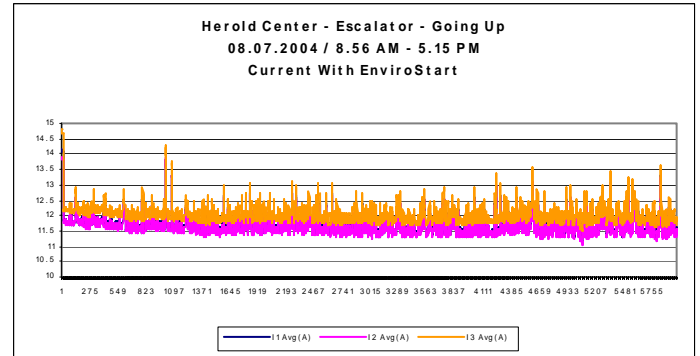

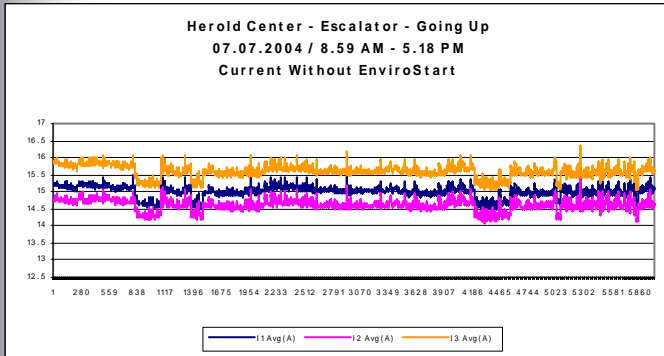

Soft start, phase loss, stalled rotor and soft stop are all valuable features for any form of passenger carrier especially escalator systems where the safety of people on the stairs is paramount.

The original control gear was located in an access passage approximately 50 metres from the motor. The start was originally by Star-Delta which was mechanically retained but the system now relies electrically, wholly on the EnviroStart for its starting, running and stopping.

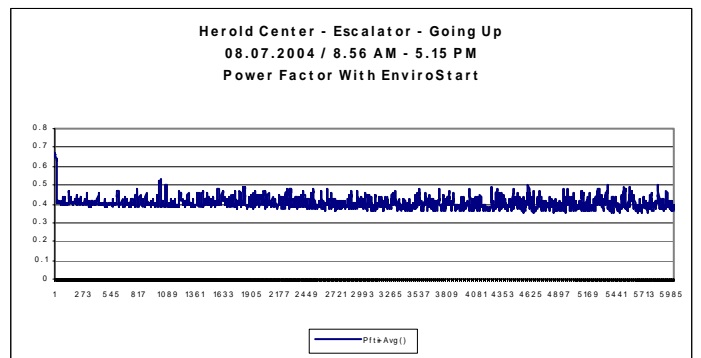

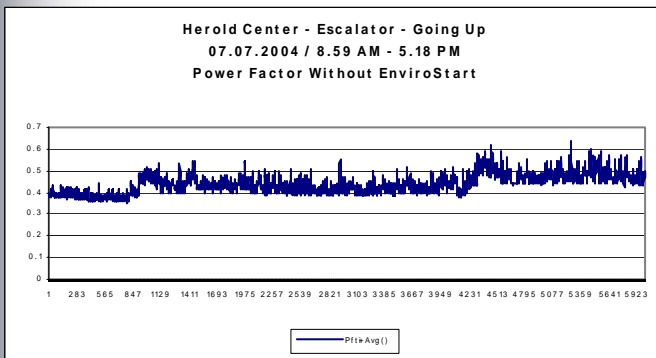

Concerns were raised by the facilities management regarding the ability of the system to be able to start if the conveyor was fully loaded. This was tested to beyond manufactures limits and found to be no problem for EnviroStart. Additionally as the safety interlock wiring had not been altered during the course of the fitting of EnviroStart all safety features, (emergency cut out, emergency stop switches et cetera), were all still fully operational. The installation was in essence therefore completely transparent to the site management other than that their energy consumption was substantially reduced.

Report of Installation on 11kW Escalator At Herold Center, Norderstedt Germany (>14% Savings with Payback <2.0 Years)

The above two graphs show the current before the installation of the EnviroStart unit and after the installation. The mean current differential when converted to kW shows a clear 14% power reduction.

The two graphs below show the change and moderation of the power factor of the motor when EnviroStart is fitted. The stabilisation will assist in reducing the likelihood of Pf peaks creating load peaks in
